Appl. No. 10/082,006 Amdt. Dated March 10, 2005 Reply to Office Action of 9/15/04 Docket No. CM03418J Customer No., 24,273

## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

1. (Currently amended) A method of monitoring a broadcast channel for a page at a mobile communication device, comprising:

receiving a broadcast signal in the broadcast channel to check for the page;

calculating the values of a plurality of channel parameters;

weighting each of the values of the plurality of channel parameters by applying a scaling factor to provide weighted values;

determining a signal quality metric by summing the weighted values upon receiving the broadcast signal;

selecting a time period based on the signal quality metric; and receiving the broadcast again to check for the page only after the time period has passed.

2. (Original) A method of monitoring a broadcast channel as defined in claim I, further comprising placing the mobile communication device into a low power mode between the selecting and receiving the broadcast signal again, the low power mode being characterized by the mobile communication device having a lower rate of power consumption than when receiving the broadcast signal.

P. 7 No.6545

Appl. No. 10/082,006 Amdt Dated March 10, 2005 Reply to Office Action of 9/15/04 Docket No. CM03418.I Customer No., 24,273

(Original) A method of monitoring a broadcast channel as defined in claim 1, wherein the signal quality metric is determined, at least in part, by the received signal strength.

- 4. (Original) A method of monitoring a broadcast channel as defined in claim 1, wherein the signal quality metric is determined, at least in part, by an automatic gain control setting of a receiver of the mobile communication device.
- 5. (Currently amended) A method of monitoring a broadcast channel as defined in claim 1, wherein the signal quality metric is determined by weighting at least two channel parameters selected from the group consisting of received signal strength of the broadcast signal, automatic gain control setting of a receiver of the mobile communication device, and a correlation value of the broadcast signal.
- 6. (Original) A method of monitoring a broadcast channel as defined in claim 1, wherein if the signal quality metric is below a preselected threshold, the selecting the time period comprises selecting a default time period.
- 7. (Original) A method of monitoring a broadcast channel as defined in claim 1, wherein the selecting the time period based on the signal quality metric comprises selecting the time period in terms of a number of time slots, the time slots defined by an air interface used by the mobile communication device.
